

Vaccar has been established since the turn of the 19th century, yet we pride ourselves on being at the forefront of technology and innovation. We have a unique range of environmentally friendly and efficient milking equipment for the modern dairy farmer. Everything from rubber ware and liners to a completely automated parlour. We are constantly developing solutions to problems that arise in the dairy industry, problems usually caused by the intensive methods that are necessary in modern farming.

As you are no doubt aware there has been a significant increase in cases of mastitis recorded this year. With some herds suffering from up to 40% infection rate.

American research has shown that the back flushing of milking units effectively reduces the risk of cross contamination by 95% when the flushing is done with clear water and by as much as 99.8% when a chemical solution is used. As a result of this research we have developed a cluster flush system that can be fitted to most parlours including swing over parlours with little or no modifications to the existing parlour. The only criteria are that there is an ACR or milk meter fitted and that when the cluster is in the parked position it hangs with all four teats down and level. This sometimes needs a small modification to existing clusters which we will implement free of charge.

If you require an innovative solution to your problems we would be delighted to see you on our stand at the Dairy Event where our dedicated team of experts will be available to advise you.
